Microsoft Power Platform

Microsoft Power Platform offers an intuitive, engaging, and straightforward way to use your data to help run your business, combining the robust capabilities of Power BI, Power Apps, and Power Automate to help you accomplish the following:

- **Analyze –** Gain insight into your data through interactive dashboards and reports
- **Act –** Leverage data insights to drive improvements to business process through applications
- **Automate –** Automate workflows to save time, conserve resources, and drive efficiencies

By combining these three functions into a single platform which integrates with the entire Microsoft suite, organizations benefit from a multi-layered approach that is more than the sum of its parts. Power Platform is designed to be used intuitively by both technical and non-technical employees, making in-depth, data driven insights available to everyone in your company. By bringing together your people, data, and processes to build a customized Power Platform solution unique to your organization, Dataprise DevOps can help your business maintain a competitive advantage in the digital-first world.
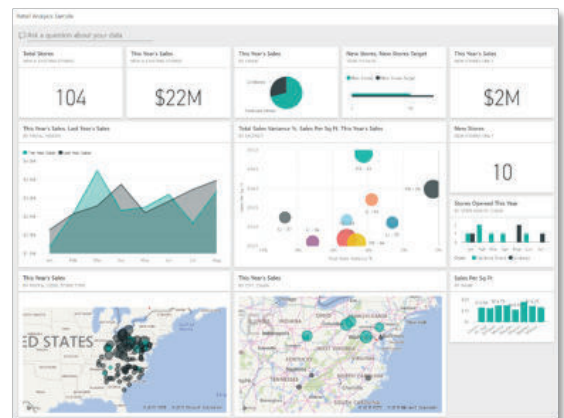

**Power BI**   **Microsoft Flow**   **PowerApps**

Power BI

Simply put, Power BI enables organizations to turn their raw data into useful information which drives deeper business insights and informs decision-making. The platform connects to data stored in a variety of Microsoft-native and third-party sources (e.g., Microsoft Common Data Service for Applications (CDS), Excel, SQL, Google Analytics, Mind-Chimp) and allows organizations to easily visualize and understand this data via interactive, customizable dashboards and reports. From there, you can slice, filter and drill-down into individual dashboards for deeper insights and share information with colleagues, ensuring that you have the information you need to inform critical business decisions.

Power BI drives impactful business insights through visually engaging dashboards

Power Apps

Power Apps allows organizations to create and deploy custom applications which optimize business processes and improve productivity. Furthermore, Power Apps enables users to create applications without writing code, making it possible for non-technical employees to derive just as much value from the platform as technical staff. Like Power BI, Power Apps connects to hundreds of data sources and systems to easily integrate with existing processes and information; unlike Power BI, this includes the ability to input data from these sources and output data back into them to ensure consistency across all systems and applications.

Accessible to both desktop and mobile devices, Power Apps applications are completely customizable and can fulfill both simple and complex functions, such as:

- Store contacts and company information
- Manage approvals and company escalation processes
- Process invoices and expenses
- Manage the sales pipeline and customer engagements

Power Apps streamlines complex tasks and projects, such as this example donation management app

---

Power Automate offers intuitive automation for complex and time-consuming business processes

Power Automate

Power Automate helps organizations build multi-stage workflows which automate repetitive business processes to help employees save time and increase productivity. With templated workflows available for many common processes, the capability to create custom orkflows from scratch, and integration with hundreds of systems and applications, Power Automate offers the flexibility to meet a diverse range of needs. Like the rest of Power Platform, all of this can be accomplished via intuitive, user-friendly interfaces which do not require technical knowledge to use, allowing your organization to save time, increase productivity, and reduce the potential for human error.

Though basic Power Automate functionality is accessible to individuals without development expertise, engaging a trusted partner to help you develop your workflows enables organizations to leverage advanced functionality involving complex, multi-system workflows and fully custom flow parts. Dataprise DevOps offers the knowledge and experience you need to unlock the full potential Power Automate has to offer and securely automate your business processes at scale.
